REPORT

ON THE

Vital Statistics of New South Wales, 1915.

Population.

The estimated population of New South Wales at the end of 1915 was 1,868,644, of whom 951,391 were males and 917,253 females. Relatively there were 104 males to 100 females. The preceding year closed with a population of 1,862,028, so that the increase during 1915 was 6,616 persons, or at the rate of 0·36 per cent. Of the total population, there were 763,000, or 40·8 per cent., within the Metropolis (Sydney), and 1,105,644, or 59·2 per cent., in the Country districts. The population and vital statistics are exclusive of the records of the Federal Capital area, which was transferred to the Commonwealth on 1st January, 1911.

The number of the people is ascertained primarily at the Census, which is taken every ten years. During the intervals estimates are made, which depend on the records of births and deaths, and of immigration and emigration. The last Census was taken on 2nd April, 1911, when the population, including aborigines, was 1,648,746; the population at the previous Census of 1901 was 1,359,133. The estimates for the intervening years have been revised to accord with the results of the Census of 1911.

As at 31st December.	Population.	Annual Increase.	Annual Increase, per cent.
1901	1,376,199	11,609	0·85
1902	1,397,858	21,659	1·57
1903	1,416,879	19,021	1·36
1904	1,440,919	24,040	1·70
1905	1,469,153	28,234	1·96
1906	1,498,609	29,456	2·00
1907	1,531,980	33,371	2·23
1908	1,560,026	28,046	1·83
1909	1,596,685	36,659	2·35
1910	1,638,220	41,535	2·60
1911	1,698,736	62,240	3·80
1912	1,778,962	80,226	4·72
1913	1,832,456	53,494	3·01
1914	1,862,028	29,572	1·61
1915	1,868,644	6,616	0·36

During 1915 the excess of births over deaths amounted to 33,275, but there was a decrease of 26,659 by an excess of emigration over immigration. The natural increase, with the exception of that of last year, is the highest yet recorded, but the last two years show an excess of departures, the first since 1903. This excess is due to the departure of troops to the war.

Marriages.

The number of marriages celebrated in New South Wales during 1915 was 18,129, corresponding to a rate of 9·70 per 1,000 of the population. The number is the highest on record, and the rate exceeded only once, viz., in the year 1857. The following table shows the average annual number of marriages and the rates per 1,000 of the population during each quinquennium of the last forty-five years:—

Period.	Average Annual Number.	Rate per 1,000 of Population.	Period.	Average Annual Number.	Rate per 1,000 of Population.
1870–74	4,091	7·77	1895–99	8,700	6·74
1875–79	4,987	7·88	1900–04	10,240	7·37
1880–84	6,738	8·39	1905–09	12,080	7·97
1885–89	7,679	7·67	1910–14	15,978	9·20
1890–94	7,954	6·80	1915	18,129	9·70

Until the year 1891 the increase in the number of marriages celebrated was remarkably steady, very few checks being experienced; but in 1892 there was a sudden decline, which continued until 1895, when the figures again took an upward movement, although the proportion married per 1,000 of the population did not reach the 1891 level until 1900. In 1901 the rate was the highest since 1886, but in the next two years it again declined largely. From 1903 to 1915, however, there was a constant improvement.

A more exact method of stating the marriage rate is to compare the marriages with the number of marriageable males and females in the community, since the marriage rate is mainly a function of age

Of the bachelors marrying in New South Wales in 1915, only 4 per cent. are outside the ages 20–44; and of the spinsters less than 2 per cent. are outside the ages 15–39. These groups have been adopted as the marriage ages of the sexes, and the following table shows, at quinquennial intervals since 1871, the proportion of bachelors and of spinsters married per 1,000 males and females within the specified groups who were unmarried:—

Year.	Proportion of Bachelors married per 1,000 unmarried males aged 20–44.	Proportion of Spinsters married per 1,000 unmarried females aged 15–39.
1871	65·60	87·07
1876	64·78	83·66
1881	65·21	82·32
1886	65·08	82·81
1891	57·85	71·28
1896	54·65	58·13
1901	65·92	62·69
1906	65·32	62·87
1911	79·11	74·96
1912	81·55	78·17
1913	77·26	73·81
1914	80·66	76·38
1915	83·35	77·93

Until the year 1886 the rate for both sexes was fairly constant. There was then a heavy drop for ten years, and in 1896 the lowest rate was reached for each sex. The next decennium showed steady and almost equal rates for males and females, and during the last six years a very high rate has prevailed generally. There has been a large increase in the marriage rate from 1906 to 1912; in 1913 the rate declined, but showed an advance during the last two years. Compared with 1906 the increase amounts to 18 per cent. in the male rate, and 34 per cent. in the female.

The marriage rate is a definite reflex of the prosperity of a country; also a high marriage rate indicates a considerable proportion of marriageable persons in the community. From either point of view, the augury in respect of New South Wales must be regarded as highly favourable.

The following statement shows the marriage rate per 1,000 of the population in each State of the Commonwealth and New Zealand during the last six years, and in a number of European countries according to latest advices:—

State.	1910–1914.	1915.	Country.	1909–1913.	1914.
New South Wales	*9·20*	*9·70*	Roumania	9·3	8·5
New Zealand	8·51	9·12	France	7·8	5·1
South Australia	9·44	9·01	Italy	7·6	7·5
Victoria	8·28	9·00	England and Wales	7·6	8·0
Queensland	8·57	8·94	Switzerland	7·3	...
Tasmania	7·85	8·03	Denmark	7·3	6·9
Western Australia	8·20	7·99	Netherlands	7·3	6·7
			Spain	7·0	6·5
			Scotland...	6·7	7·4
			Norway	6·2	6·5
			Sweden	5·9	5·8
			Ireland	5·2	5·4

New South Wales has the highest marriage rate in Australasia, followed by New Zealand, South Australia, Victoria, Queensland, and Tasmania, in the order mentioned, with Western Australia last on the list. In 1915, in all the States except South and Western Australia, the rates showed a decided improvement.

A comparison of the marriage rates of various countries may be misleading, on account of the different conditions of life prevailing, and the varying number of marriageable persons therein. In all the European countries mentioned the rate is lower than in New South Wales.

Mark Signatures.—The number of persons who signed the marriage register with marks in the year 1915 was 120, equal to 3·31 per 1,000 persons married. The number of mark signatures has steadily declined for many years past. In 1870 the proportion of signatures made with marks was as high as 18·23 per cent. of the whole, while in 1915 the percentage had fallen to ·3, the decrease in illiteracy being, therefore, highly satisfactory.

The amount of illiteracy, as displayed by inability to sign the marriage register in the proper manner, was for many years greater amongst females than amongst males, the returns showing that this was the case in every year from the commencement of registration to 1887. This order was then reversed, although in four years since there has been a slightly greater proportion of mark signatures by females. The rate is now almost the same for both sexes, 3 per 1,000 in 1915 as compared with 145 per 1,000 for the males and 194 per 1,000 for the females in 1871. The improvement clearly is enormous.

Marriages, in Religions.—Of every hundred marriages celebrated in New South Wales, about ninety-seven are solemnised by the clergy. The actual figures for 1915 show that during that year 17,624 marriages were celebrated by clergy and 505 by registrars, giving the proportions of 97·2 per cent. and 2·8 per cent. respectively.

The Church of England celebrates the largest number of marriages, the Roman Catholic Church coming next, followed by the Presbyterian and the Methodist churches.

Prior to 1908 a large number of marriages was celebrated annually at "Matrimonial Agencies," institutions which came into existence seventeen years ago, and which combined the formalities of a district registrar's office with the attendance of a clergyman. As the Registrar-General in 1907 refused to renew the licenses of certain clergymen, there have been no marriages in matrimonial agencies since that year.

The

The following table shows the number and proportion per cent. of marriages registered by the principal denominations during 1915, in comparison with the preceding five years :—

Denomination.	Marriages, 1910–1914.	Proportion per cent.	Marriages, 1915.	Proportion per cent.
Church of England	33,411	41·82	7,800	43·03
Roman Catholic	14,330	17·94	3,399	18·75
Presbyterian	11,105	13·90	2,480	13·68
Methodist	11,019	13·79	2,402	13·25
Congregational	4,167	5·22	619	3·41
Baptist...	1,414	1·77	325	1·79
Hebrew	229	·29	48	·26
All other Sects	2,509	3·14	551	3·04
District Registrars	1,705	2·13	505	2·79
Total Marriages ...	79,889	100·00	18,129	100·00

In 1915 the denominations which show an increased rate as compared with the previous five years were Church of England, Roman Catholic, and Baptist.

Condition before Marriage.—During the year 1915 of the males married, 17,129 were bachelors, 873 were widowers, and 127 were divorced. Of the females, 17,151 were spinsters, 793 were widows, and 185 were divorced. The proportion of males re-married was 5·52 per cent., and of females 5·39 per cent.

The following table shows at quinquennial intervals since 1881 the proportion of first marriages and re-marriages per 10,000 males and females respectively :—

Period.	Bachelors.	Widowers and Divorced Men.	Spinsters.	Widows and Divorced Women.
1881	9,087	913	9,044	956
1886	9,137	863	9,156	844
1891	9,229	771	9,216	784
1896	9,184	816	9,172	828
1901	9,270	730	9,268	732
1906	9,262	738	9,352	648
1911	9,407	593	9,456	544
1912	9,393	607	9,396	604
1913	9,410	590	9,413	587
1914	9,431	569	9,418	582
1915	9,448	552	9,461	539

From this it appears that the proportion of persons re-marrying has declined both among widowers and widows by about 40 per cent. since the earliest period in the table, the tendency being for re-marriages of widows to decrease at a slightly greater rate. There was a rise in the proportion between 1891 and 1896, which was followed by a larger fall during the next five years.

Age at Marriage.—Of the 18,129 couples married in 1915, the ages of bridegrooms and of brides are known in 18,127 cases. An examination of the figures shows that in 70·4 per cent. of the marriages the husband was older than the wife ; in 10·5 per cent. the ages of the contracting parties were the same ; while in the remaining 19·1 per cent. of the unions the bride was older than the bridegroom.

The results of a tabulation of the respective ages of bridegrooms and brides in 1915 are shown in the following table :—

Ages of Bridegrooms.	Ages of Brides.												
	Under 18	18	19	20	21 — 24	25 — 29	30 — 34	35 — 39	40 — 44	45 — 49	50 and over	Not stated.	Total.

Total	700	797	1,040	1,244	6,743	4,485	1,649	764	325	218	162	2	18,129

The following statement shows the average age at marriage both of bridegrooms and brides for each of the last ten years. The difference between the ages at marriage of males and females is about three and a quarter years, the males being the older :—

Year.	Average Age of Bridegrooms.	Average Age of Brides.	Year.	Average Age of Bridegrooms.	Average Age of Brides.
	Years.	Years.		Years.	Years.
1906	29·23	25·08	1911	28·81	25·32
1907	29·20	25·20	1912	28·91	25·47
1908	29·02	25·19	1913	28·85	25·56
1909	29·11	25·30	1914	28·77	25·53
1910	29·02	25·31	1915	28·71	25·51

1911 29·11 25·30

The average age at marriage, both of bridegrooms and brides, has remained practically constant during the last ten years, although there is now a tendency to a slightly lower average on the part of bridegrooms and to a slightly higher average on the part of brides. The above figures relate to all persons marrying during the year, and include those re-marrying. The average ages of those marrying for the first time during 1915 were, of bachelors 27·95 years, and of spinsters 24·99 years, or about twelve months lower in the case of bridegrooms and ten months lower in the case of brides.

Marriage of Minors.—The number of persons under 21 years of age married during 1915 was 4,465, or 12·3 per cent. of the total. The proportion of bridegrooms who were minors was 3·8 per cent., and of brides 20·9 per cent. The proportion of bridegrooms who were minors has fluctuated somewhat, but in the case of the brides the proportion has become gradually smaller. The figures at quinquennial intervals since 1881 are appended.

Period.	Minors.		Percentage of—	
	Bridegrooms.	Brides.	Bridegrooms.	Brides.
1881	149	1,660	2·37	26·42
1886	187	1,806	2·39	23·12
1891	177	2,085	2·09	24·65
1896	212	2,065	2·49	24·31
1901	351	2,546	3·33	24·15
1906	497	2,837	4·30	24·56
1911	701	3,499	4·59	22·92
1912	769	3,734	4·61	22·41
1913	705	3,514	4·32	21·54
1914	718	3,737	4·14	21·53
1915	684	3,781	3·77	20·86

Births.

The number of births during 1915 was 52,885, equal to a rate of 28·31 per 1,000 of the total population. The actual number of births is, with the exception of last year, the highest ever recorded in this State, but the rate was 2 per cent. below the average for the last five years. The birth-rate, which fell away sharply after 1888, declined largely year by year down to 1903. Since that year there has been an improvement, the rate in 1914 being, with the exception of 1912, the highest since 1895. The decrease in the rate in 1913, as compared with the previous year, is due probably to the operation of the Maternity Allowance Act, by which the Commonwealth Government provided allowances in respect of births occurring in Australia. The Act commenced on the 10th October, 1912, and had the effect of causing prompt registration of many births during the last quarter of 1912, which otherwise would not have been registered till 1913. The following table shows the average annual number of births and the birth-rate per 1,000 of the total population in quinquennial periods since 1870 :—

Period.	Number of Births.	Birth-rate per 1,000 of total Population.	Period.	Number of Births.	Birth-rate per 1,000 of total Population.
1870-74	20,733	39·36	1895-99	37,042	28·68
1875-79	24,388	38·51	1900-04	37,498	26·99
1880-84	30,417	37·89	1905-09	41,788	27·56
1885-89	36,877	36·85	1910-14	50,190	28·90
1890-94	39,550	33·80	1915	52,885	28·31

The rates shown above are calculated by the usual crude method of relating the births to the total population. It is unsatisfactory, for several reasons, so to measure the birth-rate. A preferable method for purposes of strict analysis is to relate the births according to the ages of the mothers to the total women living at corresponding ages. This method can be followed only at Census periods, since an accurate estimate of the number living at various age-groups at any other period is very difficult, on account of migration and other influences.

The ages and conjugal condition of the people of New South Wales having been obtained at the Census of 1911, the birth-rates per 1,000 women living at various groups of reproductive ages from 15 to 45 years have been calculated for the three Census periods 1891, 1901, and 1911, and are shown in the following table, distinguishing the total births from the legitimate, the illegitimate rates being shown on a later page. The total births per 1,000 of all females living at each age were as follows :—

Ages of Mothers.	1891.	1901.	1911.	Decrease per cent. in rates, 1891 to 1911.
15–19	35·30	30·87	33·75	4·4
20–24	170·90	134·65	141·45	17·2
25–29	247·48	177·95	187·35	24·3
30–34	238·81	168·42	161·20	32·5
35–39	196·15	136·60	122·27	37·7
40–44	96·61	70·79	54·51	43·6
15–44	161·74	117·46	118·50	26·7

The crude birth-rate declined sharply after 1889, and has never recovered the figure at which it then stood. From this table it will be seen that the decline has been general at all age-groups since 1891, the first year for which the ages of mothers are available. As regards the relative decrease at each age, there has been a drop, which has increased as the age increases. At ages 15-19 the decrease was 4 per cent.; at ages 25-29, 24 per cent.; at ages 40-44, it was 44 per cent. For all ages the average was 27 per cent. Although the general rate shows a slight advance in 1911 when compared with 1901, the rate for mothers over 30 years of age shows a regular decrease from period to period, from which it would appear that the rate has been maintained only by births the result of recent marriages.

The

The next table shows the legitimate births per 1,000 married women at each age.

Ages of Mothers.	1891.	1901.	1911.	Decrease per cent. in rates, 1891 to 1911.
Years.				
15–19	471·09	556·54	512·31	(+) 8·7
20–24	410·49	390·27	392·12	4·5
25–29	348·81	292·90	301·33	13·6
30–34	288·18	221·41	219·90	23·7
35–39	233·04	168·03	156·98	32·6
40–44	116·76	86·17	69·49	40·5
15–44	292·87	228·79	229·70	21·6

(+) Indicates increase.

This table shows that the rate at the youngest ages, 15-19, has advanced, and in 1911, although lower than in 1901, was higher than in 1891. Thence onward, however, as the age advances the decline has been general, amounting to 21·6 per cent. on the whole, and the disinclination of mothers for large families is clearly shown.

The birth-rate per 1,000 of the population of each State of the Commonwealth and of New Zealand during the last six years, and of a number of European countries, according to the latest advices, is given in the following table :—

State.	1910–14.	1915.	Country.	1909–13.	1914.
Queensland	28·92	29·35	Roumania	41·7	42·5
Tasmania	29·71	29·32	Italy	32·3	31·7
New South Wales ...	*28·90*	*28·31*	Spain	32·1	29·8
Western Australia ...	28·60	27·92	Prussia	29·7	...
South Australia ...	28·14	26·81	Netherlands	28·4	28·2
New Zealand	26·15	25·33	Denmark	26·9	25·6
Victoria	25·40	24·55	Scotland	26·1	26·1
			Norway	25·8	25·2
			England and Wales...	24·7	23·8
			Switzerland	24·4	...
			Sweden	24·2	22·9
			Ireland	23·2	22·6
			France	19·1	18·0

In Australasia, Queensland has the highest rate and Victoria the lowest. The birth-rate for Australia is lower than in most of the countries of the old world; but, as will be shown subsequently, this is more than counteracted by a much lower death-rate.

Birth-rates—Metropolis and Country.—Dividing the State into the Metropolitan and Country districts, there were during 1915, in the former, 20,871 births, and in the latter, 32,014, corresponding to rates of 27·55 and 28·83 per 1,000 of population respectively. Except in 1913, the Country has shown a higher rate than the Metropolis since 1893; prior to that year the Metropolitan rate was the higher.

Period.	Number of Births.			Births per 1,000 of Population.		
	Metropolis.	Country.	New South Wales.	Metropolis.	Country.	New South Wales.
1880–84	49,058	103,023	152,084	40·16	36·90	37·89
1885–89	65,866	118,517	184,383	41·50	34·69	36·85
1890–94	68,754	128,998	197,752	34·11	33·63	33·80
1895–99	61,224	123,986	185,210	26·73	29·75	28·68
1900–04	63,694	123,795	187,489	25·16	28·05	26·99
1905–09	72,409	136,529	208,938	25·50	28·80	27·56
1910–14	95,529	155,423	250,952	28·26	29·32	28·90
1915	20,871	32,014	52,885	27·55	28·83	28·31

The highest rate exhibited for the whole of New South Wales during the last thirty-four years was 38·65 in 1880. The maximum rate for the Metropolis was reached in 1884 when the births were 43·88 per thousand, and in the Country districts the greatest number of births in proportion to the population occurred in 1880 when the rate was 38·73 per thousand.

The rate has been declining in both districts since the earliest period shown in the table, but not to the same extent in the Country as in the Metropolis. In the Metropolis there was a heavy fall from 1889 to 1894, and again from 1895 to 1899; in the Country there was a corresponding fall, but it began earlier than in the Metropolis. In both Metropolis and Country the rates fluctuated very slightly during the years 1905–9, during the next decennium the rates showed an advance in each division, but in 1915 they again declined.

Sexes of Children.—Of the 52,885 children born during the year, 27,105 were males and 25,780 females, the proportion being 105 males to 100 females. In no year, so far as observation extends, have the female births exceeded in number those of the males, although the difference has sometimes been very small. The excess during the past fifty-four years has ranged from 2 per cent. in 1875, 1876, and 1901 to 9 per cent. in 1864, the average being 5 per cent.

Generally speaking, illegitimate births show greater equality of the sexes than the legitimate, and in some years they actually show a majority of female children, such instances having occurred twice during the last twenty years.

Illegitimacy.—The number of illegitimate births in 1915 was 2,681, equal to 5·07 per cent. of the total births. Comparing the records since 1880, it is found that the proportion of illegitimate to total births has continually increased throughout the State, notably in the metropolitan area. The highest proportion was reached in 1905, and since that year there has been a decline, as the actual number of illegitimate births has remained fairly constant, while the legitimate births have increased. The proportion in the Metropolis in 1915 was 7·09 per cent. of the total births, and in the Country 3·75 per cent. Doubtless, the smaller proportion in the Country districts is caused by the natural gravitation of mothers to the Metropolis, due to the presence of maternity hospitals in the Capital. The

The method of stating the illegitimate as a proportion of the total births is erroneous, because the illegitimate births have no necessary relation with the legitimate births, and because they are compared with a standard which has been declining for several years, and accordingly is itself variable; the proportion of illegitimate to legitimate births has increased, because the number of legitimate births relatively to the population has decreased largely.

The following table is therefore presented—on a similar basis to those on a previous page relating to the total, and to the legitimate births—showing the illegitimate births per 1,000 unmarried women at each age for the three Census periods 1891, 1901, and 1911 :—

Ages of Mothers.	1891.	1901.	1911.	Decrease per cent. in rates, 1891 to 1911.
Years.				
15–19	10·81	11·14	9·85	8·9
20–24	25·80	23·45	19·30	25·2
25–29	25·73	18·38	18·64	27·6
30–34	27·73	17·46	15·69	43·4
35–39	23·79	14·83	13·57	43·0
40–44	5·68	7·83	4·24	25·4
15–44	18·41	16·10	14·18	23·0

By the usual method of stating the illegitimate births as a proportion of the total births, it has appeared that illegitimacy was increasing, but from the above table it will be seen that the illegitimate rate, based upon the number of unmarried women, has steadily decreased at all ages, the decrease on the aggregate being 23 per cent. during the twenty years since 1891. The illegitimate rate shows the same characteristics as the legitimate rate. The decline has been general at all ages, but larger than in the legitimate rate.

An Act to legitimise children born before marriage, on the subsequent marriage of their parents, was passed in 1902. Under the provisions of this Act such children are deemed to be legitimate on registration, and are entitled to the status of children born in wedlock, provided that no legal impediment to the marriage of the parents existed at the time of the birth of the child. Since the Act was passed 3,649 registrations have been made.

Year.	Registrations.	Year.	Registrations.
1902	6	1910	288
1903	158	1911	394
1904	173	1912	405
1905	175	1913	298
1906	191	1914	393
1907	247	1915	416
1908	238		
1909	267	Total...	3,649

Plural Births.—During the year 1915 there were 8 cases of triplets, comprising 13 males and 10 females, and 597 cases of twins, comprising 590 males and 597 females—in all, 1,187 children (8 stillbirths not being included). Of these 605 cases of plural births, 582 were legitimate and 23 illegitimate. The number of children born at plural births formed 2·30 per cent. of the total births.

The following table shows the number of cases of twins, triplets, and quadruplets during the twenty-three years 1893–1915, excluding those stillborn, and distinguishing legitimate and illegitimate:—

Cases of—	Legitimate.	Illegitimate.	Total.
Twins	9,455	475	9,930
Triplets	88	6	94
Quadruplets ...	4	...	4

The total number of confinements recorded during the twenty-three years was 954,678. It follows, therefore, that the rate per million confinements was 10,401 cases of twins, 98 of triplets, and 4 cases of 4 children at a birth. Stated in another way, there were 105 plural births in every 10,000 confinements.

Natural Increase.

The excess of births over deaths, that is, the "natural increase," was 33,275 in 1915, and is 1,563 below last year, which was the highest on record. The excess of births over deaths does not show a steady increase or decrease, but fluctuates somewhat. In the Metropolis the least excess was in 1880, viz., 3,434, and the highest in 1914, when the number reached 13,218. In the Country districts the number ranged from 12,278 in 1882 to 21,620 in 1914.

Year.	Natural Increase.					Natural Increase per cent. of Population.
	Metropolis.	Country Districts.	Whole of State.			
			Males.	Females.	Total.	
1906	8,281	17,692	12,351	13,622	25,973	1·77
1907	8,096	17,689	12,187	13,598	25,785	1·72
1908	8,825	17,610	12,320	14,115	26,435	1·73
1909	9,312	18,617	13,297	14,632	27,929	1·79
1910	9,839	19,503	14,094	15,248	29,342	1·84
1911	10,856	19,642	14,504	15,994	30,498	1·86
1912	12,459	20,648	15,526	17,581	33,107	1·95
1913	12,597	19,805	15,091	17,311	32,402	1·82
1914	13,218	21,620	16,433	18,405	34,838	1·90
1915	12,682	20,593	15,648	17,627	33,275	1·79

The rate of natural increase is now 1·78 per cent., as against 2·25 per cent. in 1890, the decrease being due entirely to the decline in the birth-rate, as there has been a constant improvement in the death-rate.

Although the males born are more numerous than the females, the actual increase of population from the excess of births over deaths is greatly in favour of the females. The male population exceeds the female, and there is a correspondingly larger number of deaths of males. There is also a greater mortality amongst male than amongst female children, and from this cause alone the natural excess of male births is almost neutralised. During the ten years which closed with 1915 the number of females added to the community by excess of births exceeded the males by 16,682, or 12 per cent.

Although the rate of natural increase in New South Wales is low as compared with that of twenty years ago, it is exceeded by only one country outside Australasia, as will be seen from the following table. The figures represent the birth and death rates, and the difference between them (the natural increase) per 1,000 of population in each country—in the Australian States and New Zealand for 1915, and in the majority of the other countries for 1914.

Country.	Birth-rate.	Death-rate.	Natural Increase.	Country.	Birth-rate.	Death-rate.	Natural Increase.
Tasmania	29·3	10·1	19·2	Hungary (1912)	36·3	23·3	13·0
Roumania	42·5	23·8	18·7	Norway	25·2	13·5	11·7
Western Australia ...	27·9	9·3	18·6	Finland (1913)	27·1	16·1	11·0
Queensland	29·4	11·0	18·4	Austria (1912)	31·3	20·5	10·8
New South Wales	*28·3*	*10·5*	*17·8*	Scotland	26·1	15·5	10·6
Jamaica	38·9	21·4	17·5	England and Wales ...	23·8	14·0	9·8
Servia (1912)	38·0	21·1	16·9	Chile	37·0	27·8	9·2
New Zealand	25·3	9·1	16·2	Sweden	22·9	13·8	9·1
South Australia	26·8	10·7	16·1	Switzerland (1913) ...	23·1	14·3	8·8
Netherlands	28·2	12·4	15·8	Belgium (1912)	22·6	14·8	7·8
Japan (1911)	34·1	20·4	13·7	Spain	29·8	22·1	7·7
Victoria	24·6	11·1	13·5	Ireland	22·6	16·3	6·3
Prussia (1913)	28·2	14·9	13·3	Ceylon	38·1	32·2	5·9
Italy	31·1	17·9	13·2	France	18·0	19·6	(—) 1·6
Denmark	25·6	12·6	13·0				

It will be seen that the countries with the highest birth-rate have not necessarily the highest rate of natural increase. The increase in population also depends upon the death-rate, which to a considerable extent is influenced by the birth-rate. Of countries outside Australasia, Roumania, owing to an exceedingly high birth-rate, stands first on the list. Of the Australian States, Tasmania is first, followed by Western Australia, Queensland, and New South Wales in close order. Victoria is lowest.

Deaths.

The deaths during 1915 numbered 19,610, equal to a rate of 10·50 per 1,000 of the population. The rate is 3·7 per cent. above that of last year, and slightly above the mean rate for the last ten years. The total includes 11,457 males and 8,153 females, so that amongst males the rate was 11·92, and amongst females 8·99 per 1,000 living of each sex. The average annual number of deaths of each of the sexes, with the rate per thousand, in quinquennial periods from 1870, is given below.

Period.	Average Annual Number of Deaths.			Death-rate per 1,000 of total Population.		
	Males.	Females.	Persons.	Males.	Females.	Persons.
1870-74	4,391	2,948	7,339	15·58	12·32	13·93
1875-79	6,199	4,360	10,559	17·99	15·10	16·67
1880-84	7,286	5,124	12,410	16·55	14·14	15·46
1885-89	8,461	6,043	14,504	15·43	13·36	14·49
1890-94	8,877	6,344	15,221	14·06	11·77	13·01
1895-99	9,002	6,514	15,516	13·11	10·77	12·01
1900-04	9,195	6,733	15,928	12·65	10·17	11·47
1905-09	9,076	6,583	15,659	11·52	9·04	10·33
1910-14	10,598	7,555	18,153	11·66	9·13	10·45
1915	11,457	8,153	19,610	11·92	8·99	10·50

The death-rate has fallen steadily from the earliest period to the latest amongst both sexes, but slightly more for males than for females. The death-rate for males is, however, about one-fourth higher than for females, the reason being that males are exposed to more risks than females, and that male infants are the more delicate. It will be noticed that the death-rate has declined largely since the period 1890–94, and is thus coincident with the decline in the birth-rate. The falling birth-rate has influenced the death-rate in so far as it has affected the age constitution of the population by reducing the proportion living at the first five years where the mortality is high, and at the same time increasing the proportion living at ages from 5 to 20 where the mortality is low. The decline in the death-rate is also coincident with the inauguration of the Metropolitan sewerage scheme, as mentioned below.

For comparative purposes a table of the death-rates per 1,000 of population in each of the Australian States and New Zealand, during the last six years, and in a number of European countries according to the latest advice, is given below :—

State.	1910–1914.	1915.	Country.	1909–1913.	1914.
Victoria	11·56	11·10	Roumania	25·3	23·8
Queensland ...	10·34	11·00	Spain	22·9	22·1
South Australia ...	10·36	10·67	Italy	20·0	18·7
New South Wales ...	*10·45*	*10·50*	France	18·3	19·6
Tasmania	10·46	10·11	Ireland	16·8	16·3
Western Australia	10·01	9·26	Prussia	16·1	...
New Zealand ...	9·35	9·06	Scotland	15·4	15·5
			Switzerland ...	15·1	...
			England and Wales	14·0	14·0
			Sweden	13·9	13·8
			Norway	13·4	13·5
			Netherlands ...	13·3	12·4
			Denmark	13·0	12·6

New South Wales occupies the fourth place on the list for 1915, more favourable rates being shown by New Zealand, Western Australia, and Tasmania.

The comparatively favourable conditions of Australia will be manifest from an inspection of these rates.

It might have been expected that in any case the rates in the European countries would be higher than in New South Wales on account of the larger proportions of old persons in their populations, but in addition it must be remembered that some of the endemic scourges of the old world are unknown in Australia; also, apart from climatic conditions, which are most favourable here, the social condition of the great body of the people is far superior to that of Europeans, and their occupations on the whole more conducive to health. The enforcement also of the provisions of many Acts of Parliament dealing with the general health of the community, such as, the Public Health Act, Dairies Supervision Act, and Pure Food Act, besides regulations framed by local government authorities, conduce to the good health of the people.

Deaths—Metropolis and Country.—It is not possible to show the exact difference between urban and rural mortality in New South Wales, but an approximate idea may be obtained from a comparison of the experience of the Metropolis with that of the Country Districts, although a few large towns are contained in the latter. Separating the State into these two broad divisions, there were, during 1915, 8,189 deaths in the Metropolis and 11,421 in the remainder of the State, corresponding to the rates of 10·81 and 10·29 per 1,000 living respectively. The average annual number of deaths and the rate per thousand in each of these divisions since 1880, in five-year periods, is given in the subjoined table :—

Period.	Metropolis.		Country Districts.		New South Wales.	
	Average Number of Deaths.	Rate per 1,000.	Average Number of Deaths.	Rate per 1,000.	Average Number of Deaths.	Rate per 1,000.
1880-84	5,033	20·60	7,377	13·21	12,410	15·46
1885-89	6,181	19·47	8,323	12·18	14,504	14·49
1890-94	5,979	14·83	9,242	12·05	15,221	13·01
1895-99	5,634	12·39	9,882	11·86	15,516	12·01
1900-04	5,845	11·54	10,083	11·42	15,928	11·47
1905-09	5,979	10·53	9,680	10·21	15,659	10·33
1910-14	7,312	10·81	10,841	10·23	18,153	10·45
1915	8,189	10·81	11,421	10·29	19,610	10·50

Both in the Metropolis and in the Country the rate has declined steadily, but very much more in the Metropolis, whose rate is now not much higher than that of the Country Districts, whereas thirty years ago it was 50 per cent. higher. The fall began in the Metropolis after 1889, the year when the improved sewerage system was installed, and about the same time that the Dairies Supervision Act came into operation. The decline in the rates for each division and for the State will be appreciated when it is stated that the Metropolitan rate fell from 19·5 in the period 1885-9 to 10·8 per 1,000 in 1915, or 46 per cent.; the Country rate from 12·2 to 10·3, or 16 per cent.; and the rate for the whole State from 14·5 to 10·5, or 28 per cent.

Mortality of Infants and Young Children.

Children under 1 year.—The number of children under 1 year of age who died in 1915 was 3,603, equal to a rate of 68·1 per 1,000 births. The rate is the lowest on record and is 8 per cent. below the average of the last ten years, which included several years of exceptionally low infantile mortality. Male infants died at the rate of 74·6 per 1,000 births, and female infants at the rate of 61·3 per 1,000 births. To the total the Metropolis contributed 1,516 deaths, or 72·6 per 1,000 births, and the Country 2,087, or 65·2 per 1,000 births.

The next table gives the average annual number of deaths of children under 1 year, in quinquennial periods since 1880, in the Metropolis and Country, and the proportion per 1,000 births.

Period.	Metropolis.		Country.		New South Wales.	
	Deaths under 1.	Rate per 1,000 Births.	Deaths under 1.	Rate per 1,000 Births.	Deaths under 1.	Rate per 1,000 Births.
1880-84	1,707	174·0	1,956	94·9	3,663	120·4
1885-89	2,168	164·6	2,256	95·2	4,424	120·0
1890-94	1,908	138·8	2,471	95·8	4,379	110·7
1895-99	1,646	134·4	2,572	103·7	4,218	113·9
1900-04	1,416	111·2	2,399	96·9	3,815	101·7
1905-09	1,255	86.7	2,035	74·5	3,290	78·7
1910-14	1,437	75·2	2,211	71·1	3,648	72·7
1915	1,516	72·6	2,087	65·2	3,603	68·1

The infantile mortality rate has improved more in the Metropolis; in fact, until 1900, it was increasing in the Country districts. In the year 1904 there was a large decrease in both divisions compared with the rate for the previous five years, which improvement continued in 1905 and 1906. In 1907, in consequence of an epidemic of whooping-cough, the rate took an upward movement, proportionally greater in the Country than in the Metropolis, but it has since declined. The upward movement in the rate in 1913 was greater in the Country districts than in the Metropolis. In all years prior to 1913 the rate in the Rural districts has been more favourable than in the Urban.

The improvement in the rate in the Metropolis is, no doubt, partly due to the preventive measures taken by the Sydney Municipal Council to reduce the deaths from diarrhœal diseases, which had largely contributed to the infantile mortality. These measures were initiated in 1903 by the distribution of instructional circulars and pamphlets for the guidance of mothers regarding the care and feeding of young children. The circulars are despatched to the mother immediately after the registration of a birth in the thickly-populated areas of the city. In 1904 the scheme was supplemented by the appointment of a trained female inspector to visit the houses in those districts as soon as possible after the registration of a birth therein, with the object of instructing the mothers and encouraging them in the exercise of hygienic principles in the care of their infants. The satisfactory results achieved within the city boundaries led to the appointment in 1909 of an additional health visitor to carry out similar work in the more populous suburbs immediately surrounding the city.

The

The following statement furnishes a comparison of the rates of infantile mortality in the Australian States, New Zealand, and in various other countries; the rates indicate the deaths under one year per 1,000 births.

State.	1914.	1915.	Country.	1913.	1914.
Tasmania	68·6	72·2	Chile	255	286
Victoria	78·3	68·8	Roumania	202	187
New South Wales ...	*69·7*	*68·1*	Ceylon	189	213
South Australia	76·0	67·3	Italy	137	...
Western Australia ..	68·2	66·6	Ontario, Canada ...	117	103
Queensland	63·9	64·0	Finland	113	...
New Zealand	51·4	50·1	Scotland	110	111
			England and Wales ...	108	105
			Ireland	97	87
			Denmark	94	98
			Netherlands	91	95

The rates in Australasia are much lower than those in the other countries, that for New Zealand being the most favourable.

Of the total number of deaths of infants under 1 year of age, about one-third die within a week of birth, by the end of the first month the proportion is over two-fifths, and by the end of three months three-fifths. Approximately one in every 40 children born dies within a week of birth. The following statement shows for 1915, in comparison with the average of the five preceding years, the deaths per 1,000 births during each of the first four weeks after birth, and then for each successive month. The experience in the Metropolis is distinguished from that in the Country districts, and the sexes are taken together. Also for the year 1915, illegitimate children are distinguished from legitimate for the State as a whole.

Age	Metropolis.		Country.		New South Wales.

Total under 1 year ..	75·2	72·6	71·1	65·2	72·7	64·2	141·0	68·1

In the first week of life the mortality is more than five times as great as in the second, and in the second about twice as great as in the fourth. From the first month to the second the mortality falls rapidly, and from the second to the twelfth gradually. Comparing the mortality in the two divisions of the State—Metropolitan and Country—the usual experience is that at every stage of life children die more quickly in the Metropolis. In 1915 the Metropolitan rate was 72·6, and the Country rate 65·2 per 1,000 births. The year 1913 is the first occasion on which the Country rate has exceeded the Metropolitan. The experience of the previous five years shows the Metropolitan rate 6 per cent. higher than the Country. At the earlier ages the difference was greatest, the Metropolitan rate being 32·1 per 1,000 during the first four weeks, as compared with 31·0 in the Country. From one month onward the differences fluctuate, the Country rates being the lower.

This table also shows the great waste of life among illegitimate children, the mortality under 1 year being 141·0 per 1,000 births as compared with 64·2 among legitimate children. The largest proportional excess is not immediately after birth, but about three months later. During the first week the mortality of illegitimates exceeds that of legitimates by 66 per cent., thereafter it increases until in the third month the excess is 500 per cent.; after this it drops irregularly, until in the eleventh month the rates are almost equal.

Children under 5 years.—Taking account of the first five years of life, it is found that there has also been a great improvement in the rates for those ages, and, at the same time, there is apparent the reason for the excessive death-rate in the Metropolis as compared with the Country districts. At every period in the table the Metropolitan rate is the higher—in some cases over 50 per cent. higher, and never below 7 per cent. in excess.

The following table shows the mortality in each division, in quinquennial periods, since 1890, of children under 5 years of age:—

Period.	Metropolis.		Country.		New South Wales.	
	Number.	Rate per 1,000 living.	Number.	Rate per 1,000 living.	Number.	Rate per 1,000 living.
1890–94	13,370	48·45	17,728	32·06	31,098	37·52
1895–99	11,027	40·77	17,436	30·97	28,463	34·15
1900–04	9,233	35·17	16,049	29·64	25,282	31·44
1905–09	8,062	27·61	13,612	23·39	21,674	24·80
1910–14	1,895	25·47	2,986	21·77	4,881	23·07
1915	2,187	24·60	2,977	19·95	5,164	21·69

The improvement in the Metropolis has been greater than in the Country; in the former the rate has decreased by 49 per cent. since 1890, and in the latter by 38 per cent. In the Country the rate did not vary a great deal until 1904, when there was a large decline, which has continued. During the year 1915 there was a saving of the lives of 24 in every 1,000 children under 5 years of age in the Metropolis and 13 in every 1,000 in the Country, as compared with the mortality rate twenty-five years ago.

Legitimate and Illegitimate.—The last table but one distinguishes legitimate from illegitimate children, and, together with the following figures, shows with what calamitous results illegitimacy is attended. The table appended gives, for 1915, and for the five years preceding, the death-rates of illegitimate children under 1 and under 5 years of age, as compared with legitimate children of like ages.

Age.	Legitimate.		Illegitimate.		Total.	
	Deaths.	Rate per 1,000 living.	Deaths.	Rate per 1,000 living.	Deaths.	Rate per 1,000 living.
Under 1 year—						
1910-14	15,901	67·21	2,338	162·78	18,239	72·68
1915	3,225	64·24	378	140·99	3,603	68·13
Under 5 years—						
1910-14	21,075	21·68	2,732	46·73	24,407	23·07
1915	4,707	20·81	457	38·47	5,164	21·69

It will be seen how unfavourable is the position, and how reduced is the chance of living, of the illegitimate child as compared with the legitimate, since at each age-group the death-rate of the illegitimate is more than twice that of the legitimate. In 1915 one-seventh of the illegitimate children born died during the year.

Index of Mortality.

In order to compare the death-rates of New South Wales with those of the other Australian States on a uniform basis, the death-rate of each State has been calculated on the assumption that its population contained the same proportion at each of five age-groups (under 1, 1–19, 20–39, 40–59, 60 and over) as was contained in the population of Australia as a whole at the Census of 1911. Similarly, in obtaining the index of mortality of each capital city, the population at the Census of 1911 of all the capital cities was taken as a standard.

The indexes of mortality during 1915 were found to be as follows, and for purposes of comparison the crude rates are attached :—

State.	Index of Mortality.	Crude Death-rate.	City.	Index of Mortality.	Crude Death-rate.
Queensland	11·28	11·00	Brisbane	13·06	13·48
Victoria	10·56	11·10	Hobart	12·99	14·77
New South Wales ...	10·49	10 50	Adelaide	12·69	13·68
South Australia ..	10·34	10·67	Melbourne	12·01	12·63
Western Australia ...	10·22	9·26	Sydney	10·80	10·81
Tasmania	10·10	10·11	Perth	*	*

* Not available.

Sydney has the most favourable index of mortality of all the capitals, and New South Wales is fourth amongst the States. Western Australia has the lowest crude rate, and Victoria the highest.

Causes of Death.

Until 1906 the system of classifying the causes of death was that adopted by the Registrar-General, England. In 1906, however, at a conference of Australian Statisticians it was agreed to adopt the Bertillon classification, and causes of death in New South Wales are now tabulated according to that classification. The Bertillon system differs in many cases from the old, and in some rather materially, so that a comparison of the results of the last nine years with previous years is, to some extent, impaired.

In the following table will be found the principal causes of death arranged in the order of fatality, together with the average number of deaths from the same causes during the previous five years, due allowance having been made for the increase of population :—

Causes of Death.	Number, 1915.	Average Number, 1910–14.	Causes of Death.	Number, 1915.	Average Number, 1910–14.
Organic Diseases of the Heart ...	1,656	1,734	Meningitis	219	187
Endocarditis	110	92	Congenital Malformations	209	166
Diarrhœa and Enteritis (under 2) ...	1,201	1,357	Diabetes	191	177
,, ,, (over 2) ...	421	341	Intestinal Obstruction	167	168
Pneumonia	1,423	1,104	Convulsions of Infants	158	172
Cancer	1,385	1,387	Appendicitis	155	143
Senility	1,247	1,249	Cirrhosis of the Liver...	150	138
Tuberculosis—Lungs	1,122	1,210	Influenza	132	136
Premature Birth	959	897	Acute Rheumatism	109	93
Bright's Disease (Acute and Chronic)	959	956	Epilepsy	100	81
Accident	937	1,128	Gastritis	91	123
Hæmorrhage, &c., of the Brain ...	720	788	Embolism and Thrombosis	89	115
Bronchitis	539	584	Whooping-cough	63	204
Congenital Debility	366	429	Alcoholism	61	72
Puerperal Condition	272	316	Syphilis...	59	60
Diphtheria and Croup	272	284	Other	3,591	3,130
Suicide	258	252			
Typhoid Fever	219	258	All Causes	19,610	19,531

Of the ten most numerous causes of death, only three showed increases when compared with the average of the previous five years. As regards diseases ordinarily fatal to infants, there were decreases in congenital debility, convulsions, diarrhœa and enteritis, and increases in malformations and premature birth.

Typhoid Fever.—The number of deaths from typhoid fever during 1915 was 219, equivalent to 1·17 per 10,000 living, which is 15 per cent. lower than the rate for the previous five years. The male rate was 1·47 and the female 0·86. This is essentially a preventable disease, and readily yields to sanitary precautions, but the rate is still high, notwithstanding the great improvement of the last twenty years. It is higher than in England, where in 1913 the rate was ·41 per 10,000, or less than one-third the rate in New South Wales.

The decline in the rate between 1888 and 1893 was very marked, and is to be traced to the influence of the Dairies Supervision Act, which began to operate in 1889. From 1893 to 1903 the rate was very even, and did not decline to any extent, but during the next quinquennium there was a considerable improvement.

The next statement gives the rate in the Metropolis and in the Country districts during the last twenty-two years, and, contrary to what might have been expected, the rate in the Metropolis has always been lower than that in the Country districts. It would appear that the drainage of some of the country towns is very defective, or that the water supply is less pure than in the Metropolis.

Period.	Metropolis.		Country Districts.		New South Wales.	
	Deaths.	Rate per 10,000.	Deaths.	Rate per 10,000.	Deaths.	Rate per 10,000.
1894–98	507	2·26	1,331	3·24	1,838	2·89
1899–1903	426	1·72	1,361	3·12	1,787	2·61
1904–1908	334	1·21	921	1·97	1,255	1·69
1909–1913	363	1·12	874	1·69	1,237	1·47
1914	80	1·08	170	1·53	250	1·35
1915	83	1·09	136	1·23	219	1·17

Most deaths occur in the summer and autumn. In 1915 there were 82 deaths in the summer months (December, January, February), and 64 in the autumn months (March, April, May).

Smallpox.—No severe epidemic of smallpox has hitherto occurred in New South Wales. The early historical records indicate that the disease in a virulent form was prevalent amongst the aborigines in 1789, and between the years 1830 and 1840, but the infection did not spread amongst the white population.

In 1877 a case of smallpox was discovered on a steamer in Sydney Harbour, and some cases occurred in residences adjoining the wharf, and on other ships in the port; 4 deaths were recorded. In 1881 the disease again broke out in Sydney, and was epidemic for several months; 3 deaths were recorded in 1881, and 23 in the following year. A few cases were reported in 1883.

From 1883 to 1913 no cases of smallpox occurred in New South Wales; those brought occasionally by ships from oversea ports were isolated in the quarantine area, and the strict observance of the quarantine regulations prevented its introduction amongst the residents.

In 1913, smallpox, of the mildest type, became epidemic in Sydney. In the absence of severe symptoms the disease escaped detection till it had become distributed throughout the metropolitan area, and thence, in a few instances, to country districts. The total number of cases notified was 2,169; in 1913, 1,070 cases with 1 death, in 1914, 628 cases with 1 death, and in 1915, 471 cases with 1 death.

Vaccination is not compulsory in New South Wales, and a very small proportion of the people become vaccinated voluntarily, except when an epidemic is imminent. This may be attributed to a general feeling of security from infection on account of the distance from countries where the disease is more or less endemic. The duration of voyages from such places has been diminished considerably by improved transit facilities, and it is now possible for cases in the incubation period to enter the State undetected by quarantine inspectors.

During the year 1913, in consequence of the occurrence of smallpox in the State, there was a great demand for vaccination; many depôts were opened, and a large number of the population (about 425,000) were vaccinated by Government Medical Officers and private medical practitioners.

Measles was the cause during 1915 of 324 deaths, equal to a rate of 1·73 per 10,000 living. The rate for males was 2·02, and for females 1·43, the male rate being the higher, which is contrary to the usual experience. In comparison with the preceding quinquennium, the rate for 1915 shows an increase of 158 per cent.

Measles is a disease chiefly affecting children, and is periodically epidemic. It was epidemic in 1898–99, when 719 deaths were recorded. Again in 1912, when there were 371 fatal cases, and the present epidemic of 1915 which was responsible for 324 deaths. Of the 324 deaths last year, 233 were of children under 5, and 54 of children under 1 year of age. The rate would be more accurately stated if the deaths were compared with the children living of like ages; this will be found in a subsequent table giving the mortality rates of ages under 1 and under 5 from the diseases to which children are particularly liable.

Scarlet Fever.—In 1915 the number of deaths from this disease was 97, equivalent to a rate of 0·52 per 10,000 of the population, which is the highest since 1903, and is 420 per cent. above the rate during the previous five years. The number of deaths in the Metropolis was 48, and in the remainder of the State 49, the equivalent rates being 0·63 and 0·44 respectively per 10,000 living in each. The usual experience discloses a rate in the Metropolis about three times as large as in the Country districts.

Scarlet fever, like measles, is an epidemic disease chiefly affecting children, and generally the rate for females is higher than for males. Scarlet fever is now not nearly so fatal as in former years. The last years of heavy mortality were 1893 and 1894, since when the rate has fluctuated, ranging from ·06 in 1912 to ·63 in 1898.

Whooping-cough is another of the diseases which chiefly affect children, and is more fatal to girls than boys. During 1915 the deaths from it numbered 63, of which 31 were of boys and 32 of girls. The rate was 0·34 per 10,000 living, and is 69 per cent. below the average of the preceding five years. In 1907 whooping-cough was epidemic, and 594 cases proved fatal, the rate being the highest since 1878.

This disease does not show any marked tendency to decline, the rate being maintained by epidemics. Of the children who died in 1915, 31 were under 1 year of age, and 58 under 5. *Diphtheria*

Diphtheria and Croup.—Diphtheria, with which is included membranous croup, was responsible for 264 deaths in 1915, while croup, so defined, was responsible for 8. The rate for the two together was 1·45 per 10,000 living, being 5 per cent. below the rate for the previous five years. In the Metropolis the number of deaths was 102, and in the remainder of the State 170, corresponding to rates of 1·35 and 1·53 per 10,000 respectively living in each. The rate for males was 1·44, and for females 1·47 per 10,000 living of each sex.

Until 1893 the rate did not show very much improvement, but it then declined considerably, and in 1908 was less than one-fourth of what it was twenty years ago. During the last five years the rate has shown an upward tendency, the 1913 rate being the highest for fourteen years. Nearly 92 per cent. of the persons who died from diphtheria were under 10, and about 65 per cent. under 5 years of age.

Influenza.—There were 132 deaths attributed to influenza during the year, equal to a rate of 0·71 per 10,000, which is 3 per cent. below the average of the previous five years. The rate for males was 0·76, and for females 0·65 per 10,000 living. Prior to 1891 this disease was very little known, or rather few deaths were ascribed to it, but in that year there was a very severe epidemic, and it has since always been more or less prevalent. The majority of deaths from influenza occur in the four months, July, August, September, and October.

Tuberculous Diseases.—To the several forms of tuberculosis, 1,297, or 6·6 per cent. of the total deaths in New South Wales during 1915, are attributable, being equal to 6·94 deaths per 10,000 living. This rate was 9 per cent. below the average for the preceding five years.

Tuberculosis of Lungs, or Phthisis, as it is more commonly called, with 1,122 victims, or 87 per cent. of the deaths due to tuberculosis, caused more deaths during the year than any other disease, except diseases of the heart, diarrhœa and enteritis, pneumonia, cancer, and senility. The equivalent rate is 6·01 per 10,000 living, that amongst males being 6·92 and amongst females 5·04 per 10,000. The rate improved steadily after 1885, until in 1915 it was the lowest on record, and 48 per cent. below the figure for the first-mentioned year, and is 7·3 per cent. below the average for the five years 1910–14.

The decrease in the number of deaths from phthisis and other forms of tuberculosis may be attributed to the operation of the Dairies Supervision Act of 1886, the Diseased Animals and Meat Act of 1892, and the Public Health Act of 1896. The Board of Health is empowered by these Acts to supervise dairies and the production of milk, cream, butter, and cheese, and to prevent the sale of tuberculous meat.

If the deaths be distinguished in the two divisions of the Metropolis and the Country districts, as in the following table, it will be seen that, in 1894–8, the rate in the former was 47 per cent. higher than in the latter. Since that period the rate for the Country districts has remained fairly constant, but in the Metropolis the decline has been very marked, and amounts to 48 per cent.; the reason for the decline is the establishment of hospitals for the treatment of consumptives.

Period.	Metropolis.		Country Districts.		New South Wales.	
	Deaths.	Rate per 10,000.	Deaths.	Rate per 10,000.	Deaths.	Rate per 10,000.
1894–98	2,302	10·26	2,872	6·99	5,174	8·15
1899–1903	2,490	10·03	3,136	7·18	5,626	8·21
1904–1908	2,184	7·89	2,985	6·40	5,169	6·96
1909–1913	2,171	6·70	3,335	6·45	5,506	6·55
1914	432	5·83	746	6·71	1,178	6·36
1915	401	5·29	721	6·49	1,122	6·01

The figures for the year 1915 show that out of the 1,122 persons who died from phthisis, 744 were born in Australia, and of the remainder, 95 had been resident in the Commonwealth less than five years, 68 from five to twenty years, and 184 for more than twenty years; in 31 instances neither birthplace nor length of residence was stated.

The following comparison showing the death-rates from phthisis in various countries is interesting. The rates are stated per 1,000 of total population, and thus do not take into account either age or sex, which are rather material factors. If anything, this omission makes the comparison more favourable to New South Wales and other Australian States, because here the proportion of aged persons is smaller than in the countries of the old world. There is also possibly a variation in the methods of classification of the deaths in the various countries.

Country	Death-rate per 1,000 of total Population.		Country.	Death-rate per 1,000 of total Population.	
	1909-13.	1914.		1909-13.	1914.
Ireland	1·73	1·63	Victoria	·82	·74
Norway	1·73	...	South Australia ...	·76	·65
Switzerland	1·53	...	Western Australia ...	·70	·71
Jamaica	1·49	1·47	*New South Wales* ...	·66	·64
Spain	1·23	1·23	Tasmania	·59	·49
Scotland	1·15	1·04	Queensland	·56	·45
Netherlands	1·15	1·07	New Zealand ...	·55	·60
England and Wales ...	1·05	1·05			

It will be seen that New South Wales stands fourth from the bottom of the above list. The rate n all the European countries is higher than in New South Wales, and the three with lower rates are Australasian States. The experience of the countries in the table is similar to that of New South Wales, namely, that the rate is decreasing.

Treatment of Phthisis in New South Wales.

Persons suffering from phthisis may receive treatment of a temporary character at general hospitals, but the special care and treatment of this disease is undertaken at the Government Hospital at Waterfall, and the Queen Victoria Home for Consumptives at Wentworth Falls and Thirlmere. To further combat the disease, the National Association for the Prevention and Cure of Consumption has established

an

an anti-tuberculosis dispensary in the City for the treatment of patients and the examination of contacts. A trained nurse has been appointed to visit the homes of the patients and give necessary advice as regards diet, ventilation, and hygienic measures. The number of new patients who presented themselves for treatment during the year ended 31st December, 1915, was 368 (193 males and 175 females). Old patients who attended the Dispensary during the same period numbered 174, making a total of 542 patients treated during the year 1915, the separate attendances numbering 9,708. Contacts to the number of 284 (196 males, 88 females) were also examined. There were 94 patients sent to Sanatoria, 74 to Waterfall, 16 to Thirlmere, and 4 to Wentworth Falls. A number of separate houses were visited in the suburban municipalities. Visits were also made within the City of Sydney, which is under the control of the City Health Officer. Dispensaries have also been established at Prince Alfred Hospital, Marrickville Cottage Hospital, and North Sydney. Many consider that notification should be made compulsory throughout the State.

Tuberculosis of Meninges caused 70 deaths during the year, equal to a rate of 0·37 per 10,000 living. Nearly all the victims were children, 69 per cent. being under the age of 5.

Abdominal Tuberculosis caused 35 deaths, of which 8 were males and 27 females. This is equivalent to a rate of 0·19 per 10,000 living. Included under this heading are deaths from tabes mesenterica. The disease is mostly confined to children. Of those who died during 1915, 13, or 37 per cent., were under 5 years of age.

Other Tuberculous Diseases were responsible for 70 deaths, being at the rate of 0·37 per 10,000 living.

Cancer.—There were 1,385 deaths from cancer in 1915, equal to a rate of 7·41 per 10,000 living, which is equal to the average for the preceding five years. The total comprised 720 males and 665 females, the rates being 7·49 and 7·33 per 10,000 living of each sex respectively. In New South Wales generally the male rate is the higher, which is contrary to the experience of the United Kingdom, where the female rate preponderates.

The ages of the 1,385 persons who died ranged from 2 months to 102 years, but 96 per cent. were aged 35 and over.

Cancer is probably the most feared of all diseases, inasmuch as no specific remedy is known, and in all countries for which there are records the death-rate is increasing. In the following table the rates based on the whole population are given for certain countries. The comparison, being uncorrected for age incidence, is somewhat crude, but is apparently favourable to the Australian States :—

Country.	Death-rate per 1,000 of total Population.		Country.	Death-rate per 1,000 of total Population.	
	1909-13.	1914.		1909-13.	1914.
Switzerland]	1·26	...	Victoria	·83	·83

Spain	·53	·56			
Jamaica	·18	·18			

Compared with these countries, there are six with rates lower than New South Wales, of which three are outside Australia. In all the above countries the rate shows a tendency to increase.

Diabetes.—To this cause were attributed 191 deaths in 1915, equal to a rate of 1·02 per 10,000 living, which is 7 per cent. above the average for the preceding five years. The rate for males was 0·94 and for females 1·11 per 10,000 living of each sex. Most of the deaths occur after middle life. Of the above total, 138 were of persons over 45 years of age.

Meningitis.—To inflammation of the brain or its membranes were ascribed 219 deaths, equal to a rate of 1·17 per 10,000 living. This is 17 per cent. above the average rate during the previous five years. The disease is principally one of childhood. Of those who died during the year, 96, or 44 per cent., were under 5 years of age. Included in the total are 81 deaths from cerebro-spinal meningitis.

Hæmorrhage of the Brain.—To cerebral hæmorrhage and apoplexy there were due 611 deaths, of which 343 were males and 268 females. The rate is 3·27 per 10,000 living, 3·57 for males and 2·96 for females, in each case being below the average. Generally the male rate is a little higher than the female. There has been little difference in the rate for many years—it has fluctuated, first with a tendency to decrease down to 1895, and then to increase. Possibly the variations in the rate are due to some extent to differences in classification.

Convulsions (Children under 5) caused 158 deaths during 1915, or at the rate of 0·85 per 10,000 living, which is 8 per cent. below the average of the previous five years. This disease, however, being entirely confined to children under 5, the rate is more properly stated as a proportion of those ages. Comparing, therefore, the deaths with the number living at those ages, the rate during 1915 was 0·66 per 1,000, as against 0·76, the average of the previous five years. The constant decrease in the number of deaths of children ascribed to convulsions is gratifying, indicating, as it does, a more definite diagnosis of infantile disease.

Insanity.—Insanity is classed as a distinct disease of the nervous system, but of the total number of deaths of insane persons in 1915 only 175 deaths appear in the tables as due to insanity (including general paralysis of the insane), the remaining deaths being attributed to their immediate cause. The death-rate of persons dying from insanity per 10,000 living was 1·14 in the case of males and 0·72 in the case of females.

Practically all the insane persons in New South Wales are under treatment in the various Hospitals for the Insane. At the end of 1915 there were 7,063 persons under official control and receiving treatment. This is equal to 3·78 insane persons per 1,000 of population. The average during the preceding five years was 3·74 per 1,000.

The percentage of deaths of insane persons in New South Wales is comparatively light. In 1915 there were 489 deaths, or 7·30 per cent. of the average number resident. The males who died numbered 310, and the females 179, the rates being 7·81 and 6·77 per cent. respectively.

Diseases of the Heart were the cause of 1,824 deaths, equivalent to a rate of 9·76 per 10,000 living. Of the total, 1,041 were males and 783 females, the rates being 10·83 and 8·63 per 10,000 living respectively. The rate is 3 per cent. below the average for the preceding five years.

The ages of the persons who died ranged up to 102 years; and, as might be expected, the great majority of deaths occurred after middle age had been passed, 1,503 being of persons over 45 years of age.

Included in the total are deaths from pericarditis, endocarditis, organic diseases of the heart, and angina pectoris. The largest number of deaths (about one-half of the total) was attributed to "heart disease," without further definition—that is to say, without the particular cardiac lesion being specified.

Heart disease, on the whole, is on the increase, although it may be that part of the increase is due to a better acquaintance with the action of the heart, and that many deaths which were formerly attributed to old age are now ascribed to some form of heart disease.

The death-rate for males generally is higher than for females, probably due to the greater risks and shocks to which males are exposed. The rates during the last three years show a general tendency to decline.

Bronchitis caused 539 deaths, equivalent to 2·89 per 10,000 living, which is 8 per cent. below the mean rate of the previous five years. The rate for males was 3·11, and for females 2·65. Of the total deaths, 212 were stated to be due to acute and 327 to chronic bronchitis. This disease chiefly affects the extremes of life. In 1915, of those who died, 125, or 23 per cent., were under 5, and 354, or 66 per cent., over 65 years of age.

Pneumonia.—The total deaths ascribed to pneumonia were 1,423, equal to a rate of 7·62 per 10,000 living. Included in the total are 498 deaths which were ascribed to broncho-pneumonia. Among males the rate was 9·32, and among females 5·81 per 10,000 living of each sex respectively. The rate 7·62 per 10,000 living is 29 per cent above the average of the previous five years.

Most deaths from pneumonia occur in the cold weather. In 1915 there were 713 deaths, or 50 per cent., in the four months June to September.

There has been little reduction in the mortality for some years. There was a drop after 1888, but it then steadily increased, with a few fluctuations, to the highest point on record, 9·73 per 10,000 living in 1902. The general rates have been much below the figure for that year. The rate in 1915, which is the highest during the last thirteen years, is 22 per cent. below the 1902 record. Pneumonia is most destructive amongst young children and old persons, and is more fatal to males than to females.

Diseases of Digestive System.—The deaths attributed to these diseases numbered 2,525, equivalent to 13·52 per 10,000 living, the rates for males and females being 14·41 and 12·57, as compared with 14·62 and 13·37 respectively, the rates during the preceding five years. The deaths in this system were ascribed mainly to diarrhœa and enteritis, which, with cirrhosis of the liver and appendicitis, are discussed below. Gastritis caused 91 deaths, 34 being of children under 5 years of age; and 30 deaths were caused by gastric ulcer.

Diarrhœa and Enteritis.—In 1915 there were ascribed to these two causes 1,622 deaths, or 8·68 per 10,000 living, which is 4·5 per cent. below the average of the preceding five years. The rate for males was 9·23, and for females 8·10 per 10,000 living. According to the Bertillon classification, deaths from these diseases are divided into two groups—one including children under 2 years of age, and the other all persons 2 years of age and over. In the first group there were 1,201, or 74 per cent. of the total, and in the second 421. The mortality rate of children under 2 years during 1914 was 13·5 per cent. below the average during the previous five years, being 12·28 per 1,000 children under 2, as compared with 14·19 during the years 1910–14. Of the total deaths from these causes, 862, or 53 per cent., occurred in the three summer months, January, November, and December; and 363, or 22 per cent., in the autumn, February, March, April. As a rule, about 50 per cent. of the deaths occur in the summer quarter, but in 1915 the mortality was exceptionally heavy during November and December, 695 deaths occurring during these months.

Appendicitis.—To this cause 155 deaths were ascribed in 1915, the rate being 0·83 per 10,000 living, which is 8 per cent. above the average of the preceding five years. The rate for the males in 1915 was 1·02, and for the females 0·63 per 10,000 living. This disease is much more fatal to males than to females.

Cirrhosis of the Liver was responsible in 1915 for 150 deaths, the rate being 0·80 per 10,000 living, which is 8 per cent. above the average of the previous five years. This disease is much more prevalent among males than females—the rate for the former in 1915 being 1·11, and for the latter 0·47 per 10,000 living in each sex—and is of interest in connection with the subject of intemperance.

Bright's Disease.—Of the 1,205 deaths due to diseases of the urinary system, 872 were caused by chronic nephritis or Bright's disease, and 87 by acute nephritis. Taking these two diseases together, the rate was 5·13 per 10,000 living, for males 6·73, and for females 3·44. This rate is 0·2 per cent. above the mean rate of the previous five years.

Not many persons under 35 die from nephritis, the proportions per cent. for 1915 being: Under 35, 14; and over 35, 86.

Deaths in Childbirth.—The number of deaths of women in 1915 from the diseases of childbed was 272, corresponding to a rate of 5·1 per 1,000 births. Of these, 104 were due to puerperal septicæmia, 39 to accidents of pregnancy, and 129 to other puerperal accidents. On the whole, the deaths resulting from various diseases and casualties incident to childbirth are about 6·5 per 1,000 births, or 1 death to every 153 births. During the twenty-three years ended 1915, the deaths were as follow:—

Cause of Death.	1893–1896.	1897–1900.	1901–1904.	1905–1908.	1909–1912.	1913–1915.	1893–1915. Total Deaths.	1893–1915. Proportion due to each cause.
								per cent.
Accidents of Pregnancy	132	197	176	280	143	119	1,047	16·58
Puerperal Hæmorrhage	142	159	135	106	114	112	768	12·17
Puerperal Septicæmia	369	362	378	295	442	342	2,188	34·66
Albuminuria and Eclampsia ...	100	126	113	141	179	164	823	13·04
Other Casualties of Childbirth ...	272	279	256	301	219	160	1,487	23·55
	1,015	1,123	1,058	1,123	1,097	897	6,313	100·00

Owing to the changes in classification of causes of death, the figures for the last ten years are not quite on the same basis as those for previous years, but the differences are only slight. During

During the twenty-three years, 1893–1915, of the 6,313 women who died from diseases of childbirth, 5,684 were married, and 630 single, and as there were during this period 893,076 legitimate and 61,602 illegitimate births—reckoning cases of twins and triplets as single births—it follows that amongst married women the fatal cases average 6·4 per 1,000 births, or 1 in 157, and amongst single women 10·2 per 1,000, or 1 in 98.

Violence.—Of 19,610 persons who died during the year, 1,319, or 6·73 per cent., met with violent deaths. The rate was 7·06 per 10,000, being 12·3 per cent. lower than the mean rate during the previous quinquennium. The mortality rate from violence amongst males is more than three times as great as for females, since of the deaths of this kind 1,017, or 10·57 per 10,000 living, were of males, and 302, equal to 3·33 per 10,000, were of females.

Accident.—The number of fatal accidents during the year was 937, viz., 712 of males and 225 of females, equal to rates of 7·41 and 2·48 per 10,000 living of each sex. The general rate was 5·02 per 10,000 living, which shows a decrease of 16·9 per cent. as compared with the average for the previous five years. Accidental deaths have always been very numerous, especially in the country. Of the total number registered during 1915, 291 occurred in the Metropolis, and 646 in the Country districts. As a rule, about three-fourths of the accidents occur in the Country, which contains about five-eighths of the total population.

Although the accident rate is still high compared with that of more settled countries, it has been steadily decreasing. Among males the fall has been more rapid than amongst females. Experience during the past five years shows that out of every 1,000 accidents, 146 are due to drowning, 130 to burns or scalds, 174 to vehicles and horses, 117 to falls, 105 to railways and tramways, 45 to mines and quarries, and 42 to weather agencies. The greatest number of accidents to males are due to vehicles and horses, and to females to burns or scalds.

Suicide.—The number of people who took their own lives during 1915 was 258, equal to a rate of 1·38 per 10,000 living, which is 2 per cent. above the average of the previous five years. The number of males was 208, equal to a rate of 2·16 per 10,000 living, and of females 50, equal to 0·55 per 10,000, so that the rate for males is nearly four times as great as that of females.

The means usually adopted by men for self-destruction are shooting, poisoning, cutting, or hanging. Amongst women weapons are avoided, and poison has been the means most often used. Out of every 100 cases during the last five years, 35 are by poisoning, 27 by shooting, 16 by cutting, 13 by hanging, and 6 by drowning.

Experience shows that morbidity is largely influenced by the seasons. As regards suicides this is most plainly seen amongst the males, who are more inclined to self-destruction in the first and last quarters of the year. For the ten years ended 1915 the proportion of male suicides per 1,000 during the first quarter of the year was 262; second, 233; third, 243; and fourth, 262. January, February, and December, the three hottest months of the year, usually have the largest record of suicides.

Female suicides, classified by quarters for the same period, show the highest proportion during the first quarter of the year, the figures being as follow:—First quarter, 278 per 1,000; second, 228; third, 262; and fourth, 232.

Seasonal Prevalence of Diseases.

The statement below shows the principal diseases, the deaths from which vary according to the seasons. The figures are based on the experience of the thirteen years 1903–15, and represent the proportion of deaths in each month per 1,000 deaths during the year from each cause. The actual returns were adjusted on account of the unequal number of days in the various months to render the figures comparable.

Month.	Typhoid Fever.	Influenza.	Diphtheria and Croup.	Whooping-cough.	Phthisis.	Pneumonia.	Bronchitis.	Diarrhœa, Enteritis, and Dysentery.	Bright's Disease.
January	140	40	59	95	79	50	46	145	76
February	143	23	70	73	73	43	43	126	73
March	145	20	81	66	74	47	43	111	66
April	126	34	111	84	81	60	58	107	75
May	105	49	118	78	84	73	80	70	84
June	71	86	121	66	86	101	117	40	90
July	41	113	102	78	90	117	139	30	98
August	31	170	84	83	93	135	147	24	97
September... ...	28	177	77	85	91	128	124	25	94
October	26	139	54	93	88	96	83	47	80
November... ...	47	92	65	89	83	82	69	122	86
December... ...	97	57	58	110	78	68	51	153	81
	1,000	1,000	1,000	1,000	1,000	1,000	1,000	1,000	1,000

The chief feature of the above table is the contrast between typhoid fever and diarrhœa and enteritis on the one hand, and influenza, pneumonia, and bronchitis on the other. In the first group the influence of the warm weather is the controlling factor, and in the second the cold weather. The warmest three months in the year are December, January, and February; and the coldest June, July, and August. Phthisis does not vary a great deal throughout the year, but the rates show that in the cold months the deaths are most frequent. Bright's disease also is most fatal in the cold weather.

Causes of Infantile Mortality.

The mortality of infants in New South Wales was exceptionally low since 1904. An upward movement in 1907, when the rate was higher than in any of the three preceding years, was followed by a decline in the following year, which continued until 1911. In 1912 the rate took an upward movement, and in the following year was the highest since 1907. During the year 1914 the rate again declined, and in the year under review was only 68·1 per 1,000 births, which is the lowest rate recorded, and is 8 per cent. below the average of the last ten years. Prior to 1904 there had been practically little change in the rate for thirty years. From 1860 to 1873 the rate was lower than in the years immediately preceding 1904. At the very early ages children are most susceptible to the attacks of disease, and the rates for preventable diseases are highest. Any bettering of conditions and consequent saving of infant life is a gain to the whole community. In New South Wales, out of every 10,000 children born, about 1,000 die before reaching their fifth year. As

As the death-rate of infants is usually looked upon as a reliable sanitary test, and as it is of interest to know the diseases most fatal to children, the following statement has been prepared. It shows the principal causes of death of children—under 1 per 1,000 births and under 5 per 1,000 living—in 1915 and in the five years 1910–14, distinguishing deaths in the Metropolis from those in the Country districts.

Causes of Death.	Deaths under 1, per 1,000 Births.						Deaths under 5, per 1,000 Living.					
	Metropolis.		Country.		New South Wales.		Metropolis.		Country.		New South Wales

Total	75·2	72·6	71·1	65·2	72·7	68·1	25·5	24·6	21·8	20·0	23·1	21·7

There was a considerable improvement in the rate in 1915, as compared with the preceding five years, notwithstanding they were years of low infant mortality. Among children under 1 year the reduction amounted to 6·3 per cent., and among children under 5 to 6·1 per cent

It will be seen that the high mortality of infants is due to the deaths of children who from the beginning are greatly weakened either from immaturity or debility at birth. Of children under 1, the deaths from these causes in 1915 were equal to 28·6 per 1,000 births, or 42 per cent. of the total deaths of children at that age. A previous table shows that the mortality during the first month of life is over two-fifths of the total mortality during the whole of the first year, and 86 per cent. of this mortality is due to deaths from congenital debility or defects. After these, in 1915, came diarrhœa and enteritis, which were responsible for deaths to the extent of 17·3 per 1,000 births. The deaths from infectious diseases amounted to 2·0 per 1,000 births, of which measles alone caused 1·0. Respiratory diseases are rather fatal to children—bronchitis, in 1915, accounting for 1·6, broncho-pneumonia for 3·3, and pneumonia for 1·9 per 1,000 births. These respiratory diseases were normal in 1915. Convulsions had a death-rate of 2·3, tuberculous diseases of 0·5, and meningitis (not tuberculous) of 0·7 per 1,000 births.

It has already been pointed out that life in the Metropolis is more unfavourable to children than in the Country. The total excess mortality in the Metropolis for the previous five years is 6 per cent., but the mortality from diarrhœa and enteritis is 24 per cent. higher than in the Country. It should be noted that the rates in the Metropolis and the Country in 1915 are both considerably below the quinquennial average.

Turning to the second part of the table, dealing with children under 5, it will be found that the most fatal causes, as in the case of children under 1, are congenital debility, diarrhœa and enteritis, pneumonia, measles, diphtheria, and convulsions in that order. All the rates are lower, with the exception of measles, convulsions, and pneumonia, which show an increase at the higher age; the rate for diphtheria and croup is normal.

A further statement is given below in which the cause of death of illegitimate children are compared with those of legitimate children. The figures represent the deaths of children under 1 per 1,000 births in the State as a whole in 1915.

Causes of Death.	Deaths under 1 per 1,000 Births.		
	Legitimate.	Illegitimate.	Tota
Measles	1·0	0·7	1·0
Scarlet Fever	0·1	...	0·1
Whooping-cough	0·6	0·4	0·6
Diphtheria and Croup	0·4	0·4	0·4
Tuberculosis—Meninges	0·2	1·1	0·3
,, Peritoneum	0·1	0·4	0·1
,, Other Organs	0·1	0·4	0·1
Syphilis...	0·3	4·5	0·5
Meningitis	0·7	0·4	0·7
Convulsions	2·2	4·5	2·3
Bronchitis	1·5	2·6	1·6
Broncho-pneumonia	3·2	4·1	3·3
Pneumonia	1·9	1·5	1·8
Diarrhœa and Enteritis	15·4	52·6	17·3
Congenital Malformations	3·7	2·6	3·6
Infantile Debility	6·3	17·9	6·9
Premature Birth	17·7	26·8	18·1
All others	8·8	20·1	9·4
Total	64·2	141·0	68·1

The reasons for the greater mortality of illegitimate children are seen from this table. Excluding diseases which may be ascribed to inherent weakness, there is strong evidence of neglect or want of care as regards these unfortunate children. Infantile debility showed 47·3 per 1,000 births, as against the legitimate rate, 27·7. Diarrhœa and enteritis were 52·6, as compared with 15·4; respiratory diseases 8·2, as compared with 6·6; and syphilis 4·5, as compared with 0·3. No great difference is exhibited between the legitimate and illegitimate rates for epidemic diseases.
